

Vacuum Drum Filters

Drum filters are used for continuous, mechanical separation of large quantities of solid and liquid mixtures by filtering them in a vacuum. Typical areas of application include mining, chemicals and food production.

Here, too, precise fabrication, a long service life, easy installation as well as optimum separation are required to ensure efficient filtration.

🌀 **marsyntex**® filter media are manufactured to order as rotary filter cloths or segments:

- in stitched or welded form, specially cut to the length and width of the drum
- fitted, for example, with rubber profiles or specially sealed or coated for lateral guidance
- provided with fasteners made of stainless steel or other materials
